SUMMARY

Final-year B.Tech CS student (CGPA 9.71) building quant trading infrastructure at two funds, with shipped projects across market data engineering, backtesting, and zero-knowledge systems. Adapts fast to unfamiliar stacks - picked up Rust, ZK circuits, and production data engineering from scratch and shipped working systems in each within weeks.

EXPERIENCE

Quantitative Software Developer (Intern)

Mar 2026 – Present

WIN Private Equity Ltd

International (Remote)

- Built an automated data pipeline that delivers clean daily market data for 5,500+ equities and futures (NYSE and crypto) to the trading team, ingesting and processing raw price feeds with Python and PostgreSQL.
- Developed 10+ systematic trading strategies on top of the pipeline, with the best performers reaching a profit factor of ~ 3 in backtests.
- Removed a full day of lag in daily price data by building an intraday-to-daily aggregation process, after catching accuracy gaps in yfinance through automated cross-checks.
- Made deployments repeatable across development and production by packaging the pipeline with Docker.

Entrepreneur in Residence (Intern)

Aug 2026 – Present

eigi.ai

India (Remote)

- Worked directly with the founder across product, engineering, and growth at an early-stage startup.
- Scoped technical decisions and third-party integrations (Meta, GCP, Anthropic) alongside the engineering team.
- Stepped into strategy, hiring, and whatever else the week required.

Algorithmic Trading (Intern)

Jan 2026 – Jul 2026

AimFi Capital

India (Remote)

- Cut daily stock screening from 2–3 days of manual chart-checking to under 5 minutes with a real-time engine that scans 2,200+ NSE & BSE stocks for 8+ technical chart patterns in Python.
- Delivered ranked daily watchlists that automatically flag breakouts, trendline breaks, and bullish & bearish divergences, giving traders a ready-to-act shortlist every morning.

PROJECTS

QuantLabs | *React, Node.js, Python*

2026 [Live](#)

- Built a trading-strategy sandbox that turns a plain-English strategy description into runnable Python backtest code, shipping with 8+ pre-built strategies.
- Wrote a backtesting engine that simulates execution latency for realistic fills and reports Sharpe ratio, maximum drawdown, and other risk metrics on historical price data.
- Added an automatic portfolio rebalancer that controls risk and hedges with options based on live market conditions.

WhyLine | *Python, FastAPI, React, TypeScript*

2026 [GitHub](#)

- Built a real-time anomaly detection system over live Binance data that monitors 10 crypto symbols concurrently, combining rolling z-scores with a streaming Isolation Forest to flag abnormal price moves ($|z| \geq 3$) and volume surges within a single 1-minute candle.
- Eliminated the dashboard's cold-start gap by backfilling and back-scanning 1,000 candles per symbol (~ 16 hours of annotated context) before handing off to live WebSocket streaming.
- Wrote a fully offline test suite (33 tests) covering z-score math, outlier flagging, and API parsing, working in a 4-person team.

Bhishi | *TypeScript, Compact, Midnight (ZK)*

2026 [GitHub](#)

- Built a private chit-fund protocol on the Midnight blockchain: an 8-circuit smart contract holds 100% of member contributions in trustless on-chain escrow, removing organizer-fraud risk.
- Sealed each round's bid behind a zero-knowledge commitment verified against its reveal, so losing bid amounts are never exposed on-chain and members avoid publicly signaling financial distress.
- Mirrored every on-chain circuit assertion in a TypeScript simulator with 14 tests covering sealed-bid integrity, one-win-per-cycle guarantees, and full-cycle money conservation.

Ekonos | *Rust, Solana, Anchor*

2025 [GitHub](#)

- Built a fractional asset-ownership protocol on Solana (Turbin3 Capstone) that lets several users co-own and invest in a single high-value asset.
- Designed secure on-chain vaults and token-distribution logic so each user's investment and ownership share is tracked automatically and safely.

Commit-Mirror | *Python, PyPI Package*

2026 [GitHub](#)

- Published a pip-installable CLI, now at 15+ active users, that preserves GitHub contribution graphs for developers leaving private organizations by mirroring commit metadata to a public repo with zero code or diff exposure.
- Designed a config-driven setup wizard with a dry-run preview mode and hands-off daily syncing via cron/Task Scheduler.

COPYRIGHTS

QuantLabs: NLP Based Backtesting Engine and Portfolio Rebalancer <i>SW-11555/2026-CO</i>	2026
Automated Job Application Using a Smart Browser Extension <i>LD-46176/2025-CO</i>	2025

TECHNICAL SKILLS

Languages: Python, Rust, C++, SQL, TypeScript, JavaScript	
Frameworks: FastAPI, React, Node.js, Anchor	
Developer Tools: Git, Docker, PostgreSQL, Surfpool, Postman	
Libraries: pandas, NumPy, Matplotlib	

EDUCATION

St. Vincent Pallotti College of Engineering & Technology, Nagpur	CGPA: 9.71
<i>Bachelor of Technology in Computer Science and Business Systems, minor in AI</i>	<i>2023 – 2027</i>

CERTIFICATIONS

Solana Builder Graduate <i>turbin3.org</i>	2025
School of Solana Graduate <i>ackee.xyz</i>	2025
Disaster Risk Monitoring Using Satellite Imagery <i>NVIDIA</i>	2024
Python and SQL for Data Science <i>Scaler</i>	2024

AWARDS AND ACHIEVEMENTS

Blockchain Nexus, IIT Kanpur <i>First Position</i>	2025
Stellar Ragnarok, Nagpur <i>Second Position</i>	2025
Raisoni Tech Hackathon, Nagpur <i>First Position</i>	2024
Outstanding Tech Performer, SVP CET <i>Winner</i>	2024
SIH Expo, SVP CET <i>Third Position</i>	2024
Dataverse, SVP CET <i>First Position</i>	2024
